

PARALLEL SPECIATION OF TWO WESTERN NORTH AMERICAN SKINKS (*PLESTIODON*)

Presentation by Andrew Frank

PREVIOUS WORK

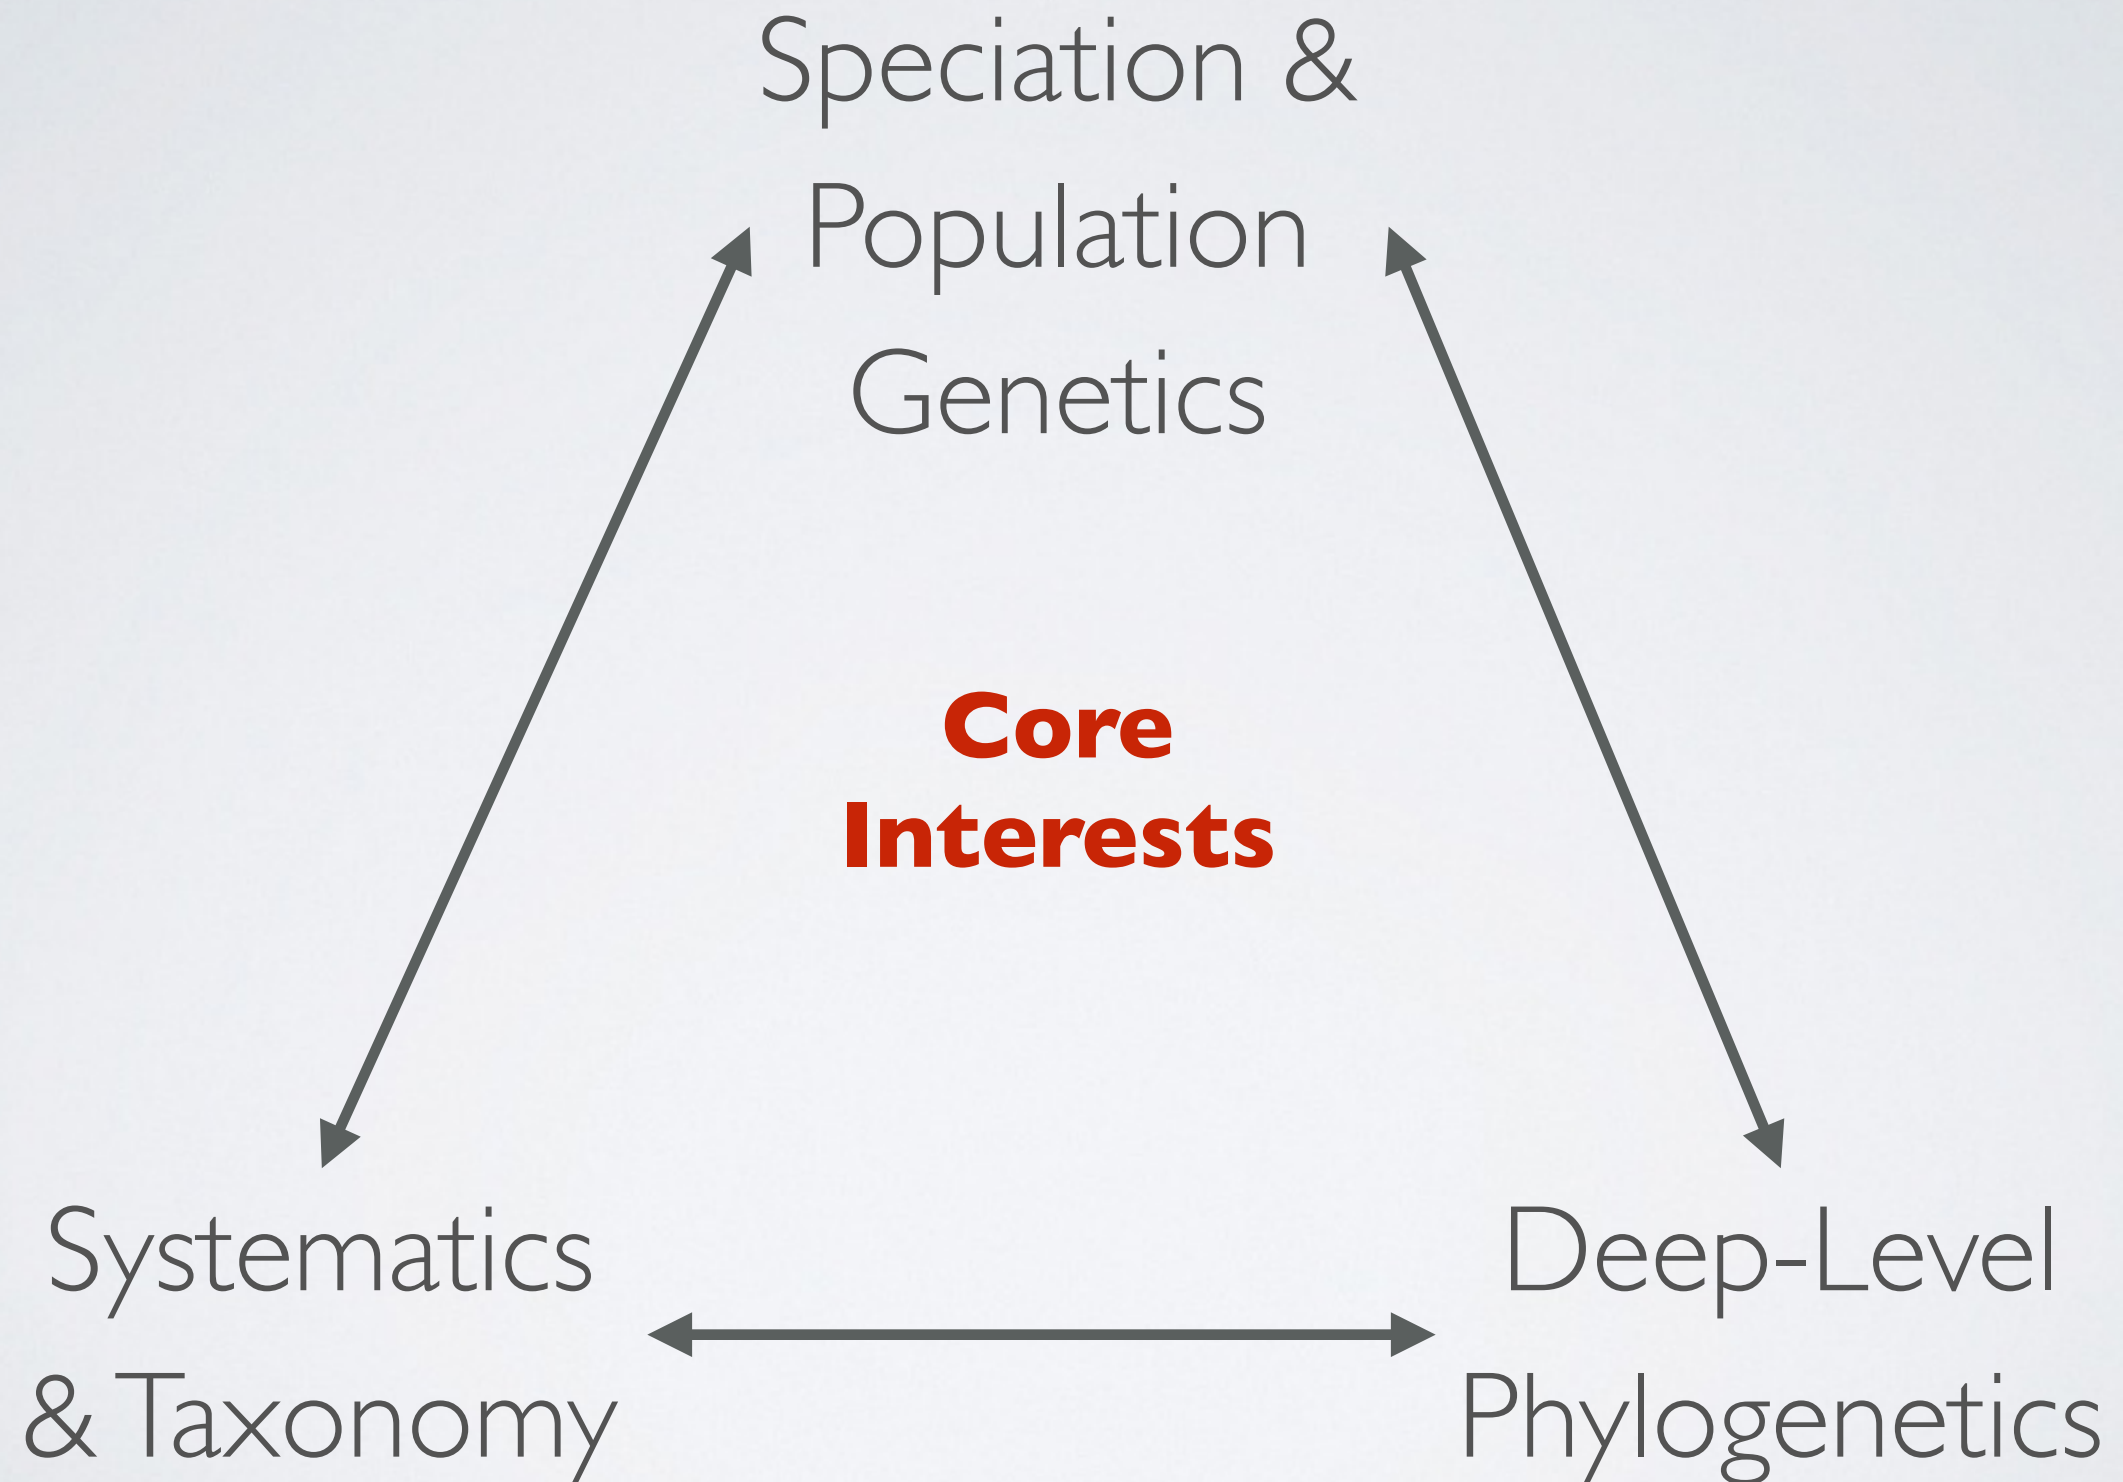

- Parallel cave invasions by amphipod *Gammarus minus*
 - Stable isotope analysis
 - Microsatellite loci

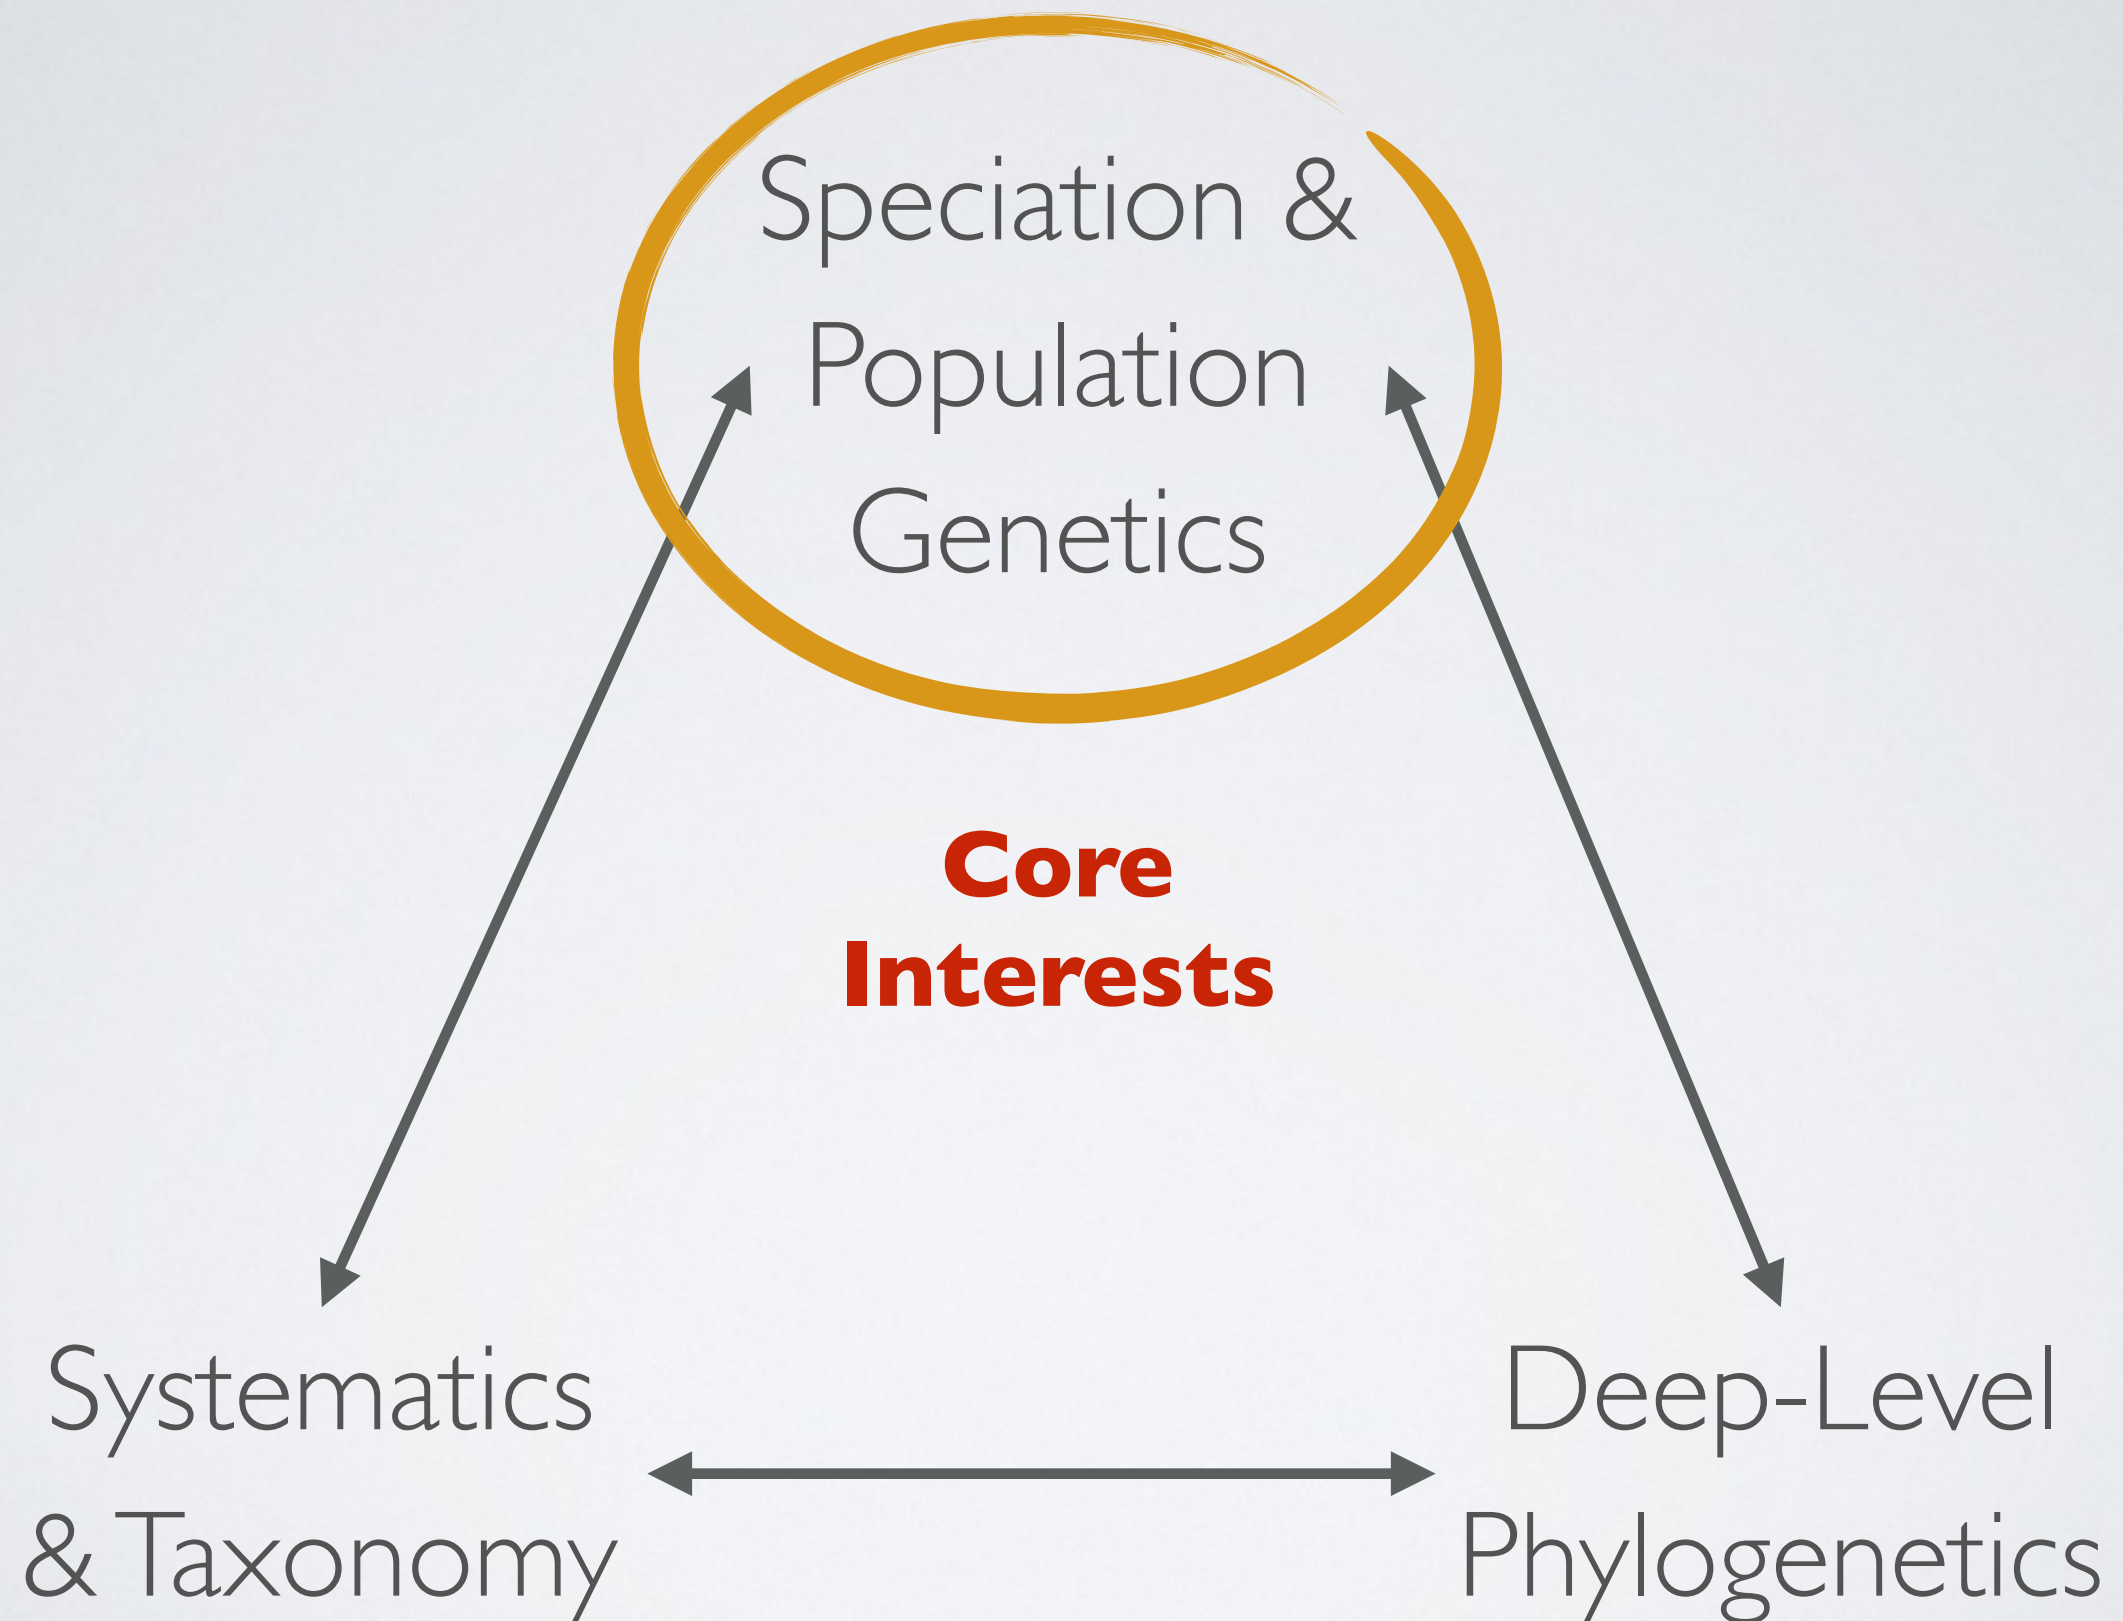

- Cryptic species delimitation of two nemertean worms
 - DNA Barcoding
 - Haplotype network analysis

CURRENT WORK

SPECIATION

Parallel Evolution

SPECIATION

Parallel Speciation

SPECIATION

Parallel Speciation

B and **C** are more reproductively compatible than either is with **A**, resulting in the new lineage **D**

P. SKILTONIANUS GROUP

P. SKILTONIANUS GROUP

- Small bodied adults
- Mesic
- Coastal
- High elevations

P. SKILTONIANUS GROUP

Plestiodon skiltonianus

- Small bodied adults
- Mesic
- Coastal
- High elevations

- Large bodied adults
- Xeric
- Inland
- Low elevations

Plestiodon gilberti

P. SKILTONIANUS GROUP

Adult

*Plestiodon
skiltonianus*

*Plestiodon
gilberti*

MITOCHONDRIAL TREE

* indicates BPP ≥ 0.98

(Adapted from Richmond et al. 2007)

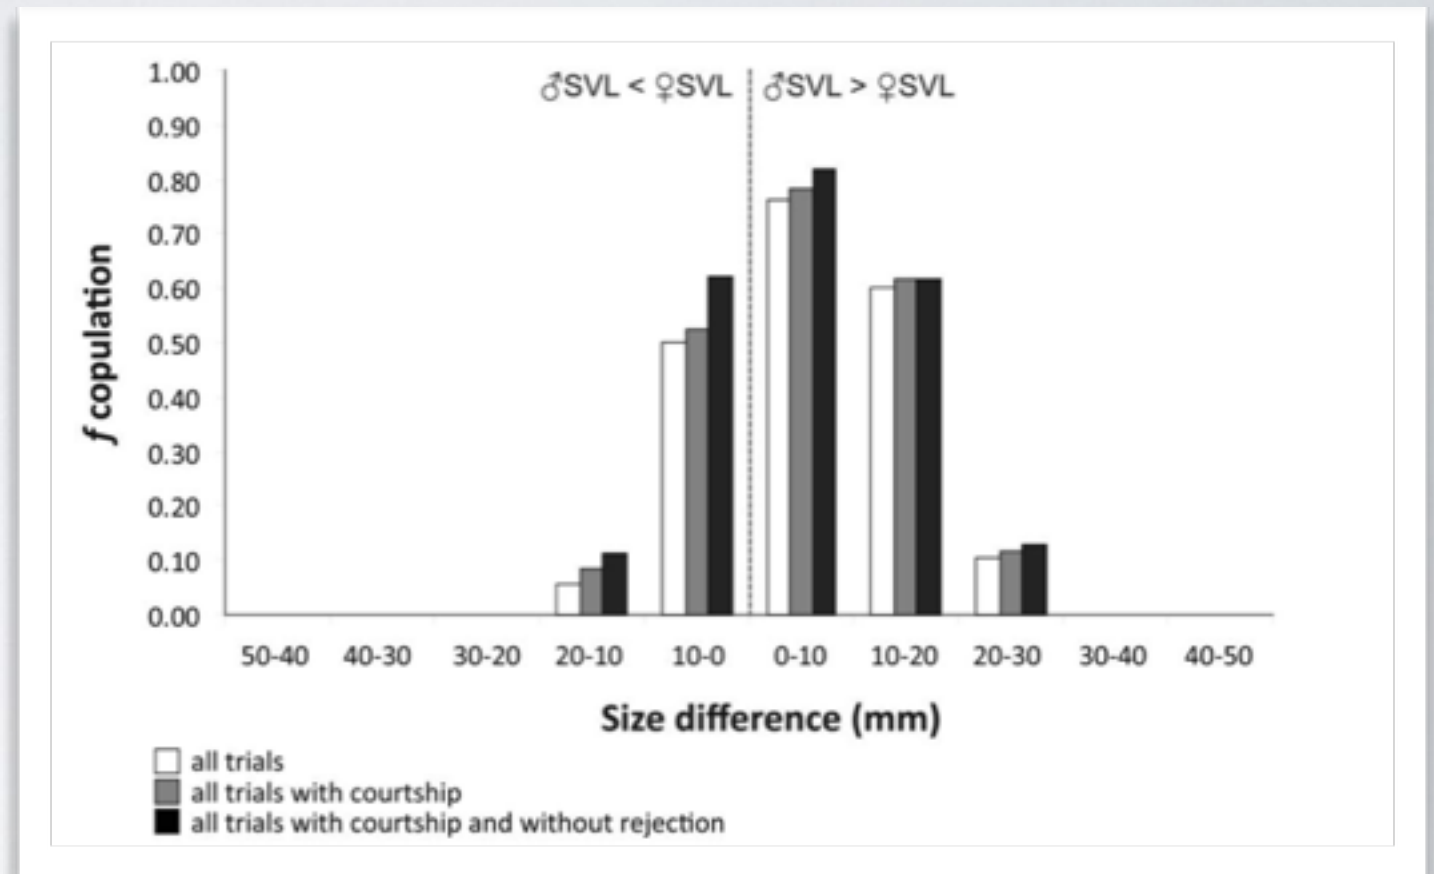

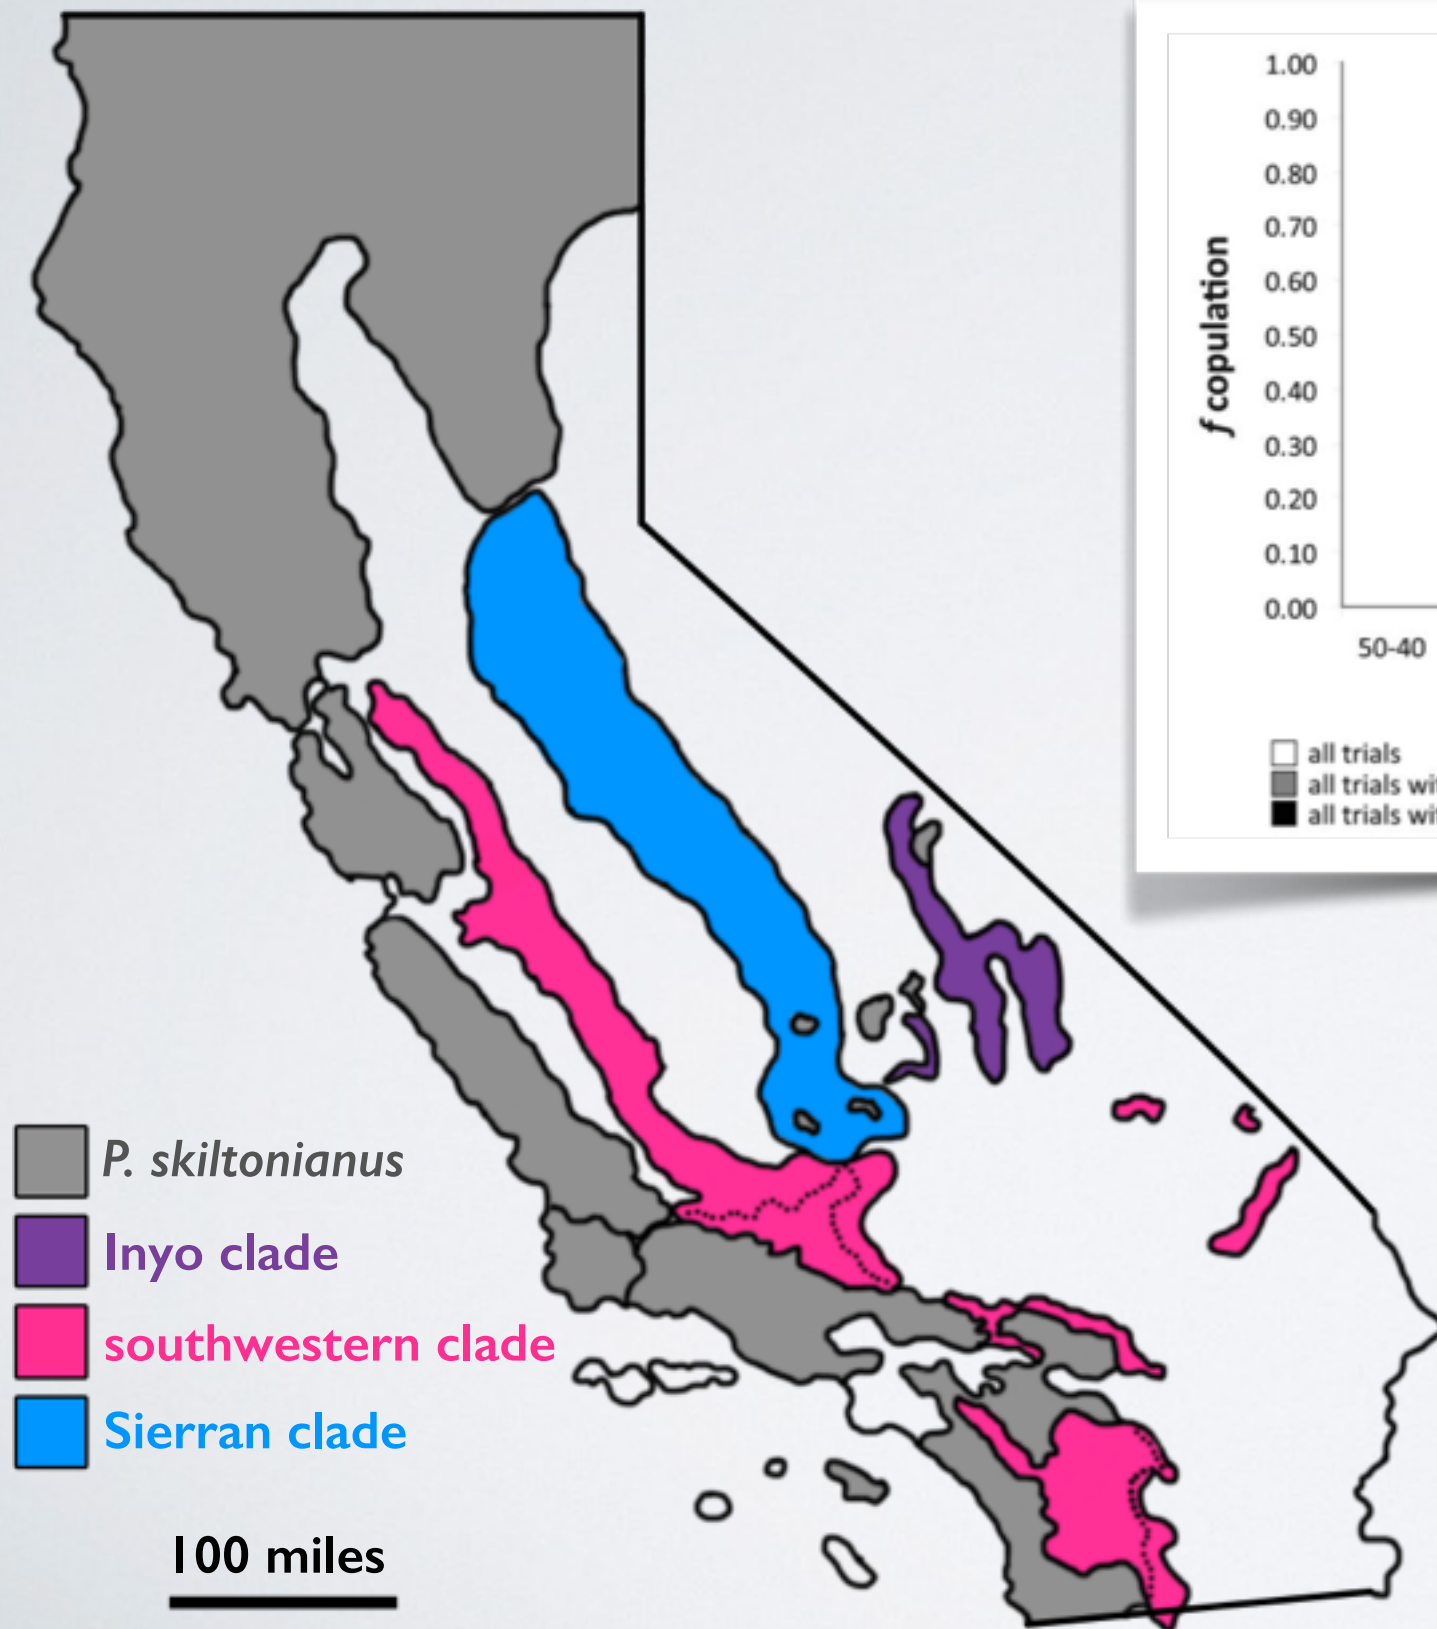

ISOLATION BY SIZE

- Parapatric distribution between *P. skiltonianus* and *P. gilberti*
- Parapatric distribution between 3 *P. gilberti* clades
- Introgression between the 3 *P. gilberti* clades

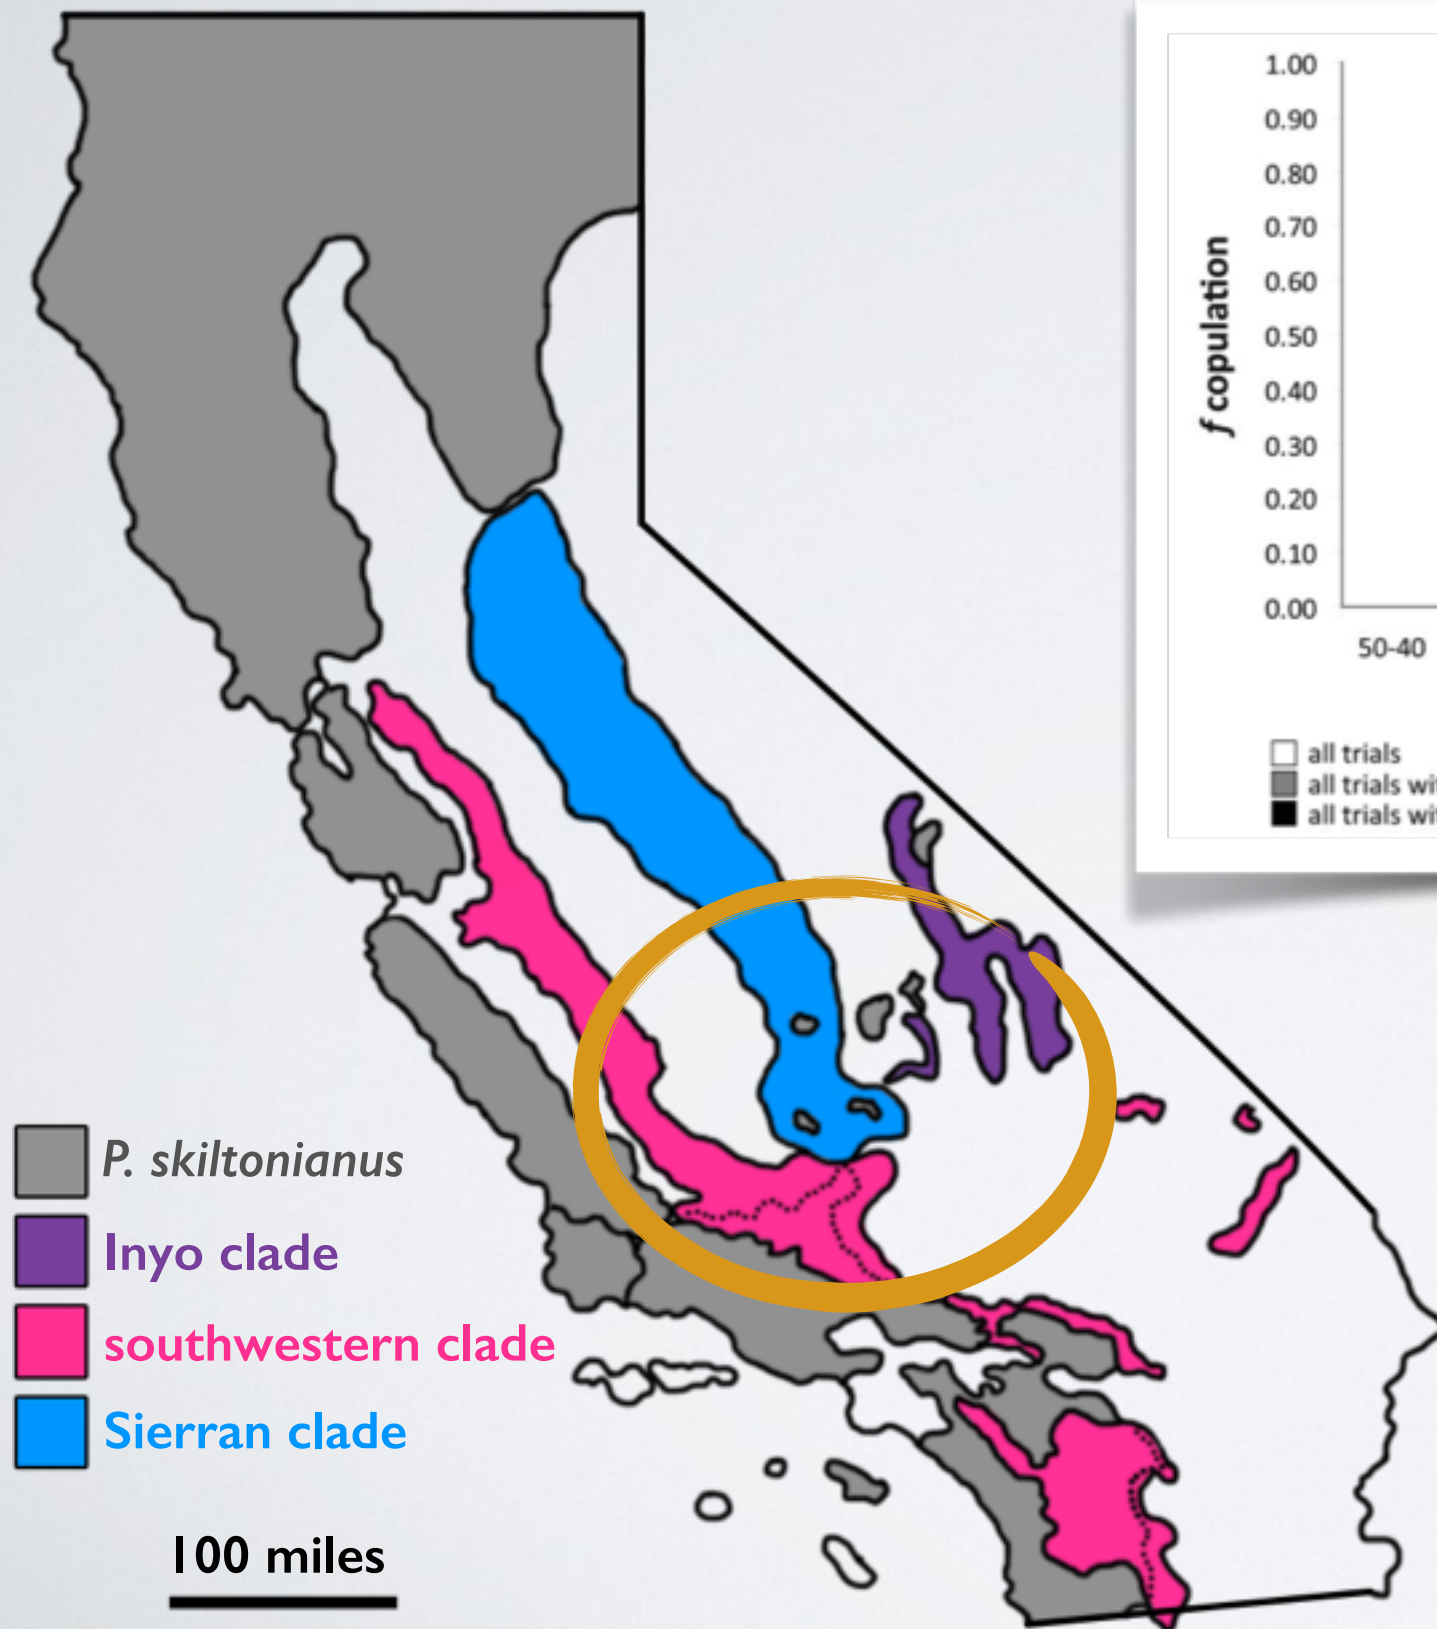

(Adapted from Richmond et al. 2007 & Richmond 2011)

ISOLATION BY SIZE

(Adapted from Richmond et al. 2007 & Richmond 2011)

ISOLATION BY SIZE

- AFLP data suggests isolation-by-distance across *P. gilberti* contact zone

(Adapted from Richmond et al. 2007 & Richmond 2011)

PARALLEL SPECIATION CRITERIA

Clades have...

- ☐ reproductive incompatibility with a divergent sister clade
- ☐ reproductive compatibility with one or more convergent sister clades
- ☐ independent origins

PARALLEL SPECIATION CRITERIA

Clades have...

- ☒ reproductive incompatibility with a divergent sister clade
- ☒ reproductive compatibility with one or more convergent sister clades
- ☐ independent origins

HOW DO I GET COALESCENCE TIME DISTRIBUTIONS?

“Identifying a bimodal distribution in gene tree coalescent times with empirical data, which is suggestive of genetic exchange, **will require more loci than are typically available**, but this constraint is vanishing as more studies shift towards new sequencing technologies.” (Leaché et al. 2013)

HOW DO I GET COALESCENCE TIME DISTRIBUTIONS?

“Identifying a bimodal distribution in gene tree coalescent times with empirical data, which is suggestive of genetic exchange, **will require more loci than are typically available**, but this constraint is vanishing as more studies shift towards new sequencing technologies.” (Leaché et al. 2013)

**Leverage anchored phylogenomics
to capture ~500 loci**

NEXT STEPS

- Sample from allopatric portions of *P. skiltonianus* and *P. gilberti* ranges, including from well-separated portions of the different *P. gilberti* mitochondrial lineages
- Use anchored phylogenomics to capture sequence data from ~500 loci for each sample
- Generate a distribution of coalescence times across all loci, and gene tree topologies for each loci using BEAST

THANK YOU!
